The present invention describes a Babesia canis associated protein (1), comprising a Bcvirl5 protein of 15 kD molecular weight (FWM) and having a sequence of at least 80% homology to a sequence (ABP53714) of 141 amino acids, or a Bcvirl2 protein of 32 kD WM and having a sequence of at least 80% homology to a sequence (ABP53715) of 285 amino acids, or their immunogenic fragments. (1) have antiparasitic and immunostimulant activities, and can be used in vaccines. (1) can also be used for the preparation of a vaccine for combating B. canis infections. (1) is also be useful in a diagnostic test for the detection of antibodies against B. canis associated antigenic material. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Babesia canis; Bcvir15; 15kD protein; Bcvir32; 32kD protein; infection; antiparasitic; immunostimulant; vaccine.

combating Babesia canis infections

Claim 2; Fig 3; 41pp; English.

us-10-08/-5/3-2.011go.rag

The present invention describes a Babesia canis associated protein (I), comprising a Bcvir15 protein of 15 kD molecular weight (MW) and having a sequence of at least 80% homology to a sequence (ABP53714) of 141 at least 80% homology to a sequence (ABP53715) of 285 amino acids, or their immunogenic fragments. (I) have antiparasitic and immunostimulant activities, and can be used in vaccines. (I) can also be used for the preparation of a vaccine for combating B. canis infections. (I) is also be useful in a diagnostic test for the detection of antibodies against B. canis associated antigenic material. The present sequence represents

The present invention describes antigenic peptides (I) comprising:

(a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino cards. Also described: (I) an assay for the detection of a particular of a particular GPCR. Or a candidate polypeptide in a sample; and (2) an isolated antibody having high specificity and high affinity cor a violative for a particular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibody against a particular GPCR, and in the production of specific an antibodies. The peptides and antibodies are also useful for detecting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for disquesting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for disquesting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for disquesting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies for discases, or autoimmune diseases, immunological-related disease, collisease, atherosolerosis, bacterial, fungal, protozoan or viral infections, osteoarthritis, osteoprososis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohn's disease, graft versus host disease, parkinson's disease, multiple sclerosis, pain, psoriasis, or anxety, depression, schizophrenia, dementia, mental retardation, memory conversion, renal disorders, rheumatoid arthritis, trauma, ulcers, or hypotension, renal disorders, rheumatoid arthritis, trauma, ulcers, or convergence or my other disorders, rheumatoid arthritis, trauma, ulcers, or any other disorders in hambodiscapis, absentia, mental retardation, memory cused in immunoassays and immunodiagnosis. ABB24553 to ABB242869 encode cose exemplification of the present invented. The antibodies may be compared to the present invented in invented in very antibodies may be compared to th New isolated antigenic peptides e.g., for G protein-coupled receptors (GPCR), useful for diagnosing and designing drugs for treating conditions in which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or autoimmune diseases Claim 1; Fig 2; 523pp; English.

(HUMA-) HUMAN GENOME SCI INC

Rosen CA, Barash SC, Ruben

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

Claim 11; SEQ ID NO 13358; 3071pp + Sequence Listing; English.

AAKS4951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM92170 to AAM91221. (I) have cytostatic activity, and can be used in gene therepy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27252 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations of deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) proteins and polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic article articles aspecially sequences from the present invention. AAK45492 to AAK454950 and AAM82169 represent sequences used in the exemplification of the present invention. Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; mimune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis; myasthenia gravis. Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders Query Match 5.0%; Score 7; DB 22; Length 97; Best Local Similarity 100.0%; Pred. disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with OREX associated disorder. OREX polymucleotide sequences can be used in gene therapy. OREX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders, haemorrhage, transplantation, cardiovascular diseases, disorders mellitus, systemic transplantation, cardiovascular diseases, disorders mellitus, systemic storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune thyroidismic myasthenia gravis, graft-versus-host disease and autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eve disease. OREX proteins are also useful for treating burns, inclaions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cycokine damage.

N.B. The sequence data for this patent did not format directly from WIPO tre fib. int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

                                                                                                                                                                            Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
             production of other overlines in other cell populations. The production of other overlines in other cell populations. The polymerlectides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoises regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
cell proliferation or cell differentiation or which may induce
                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and disorders related to organ transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequences ABP31028-ABP35561 represent 4534 novel human proteins

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -

Disclosure; SEQ ID NO 32805; 21pp + Sequence Listing; English

18 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention iuseful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/published\_pct\_sequences.

Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris -

Example 1; SEQ ID No 3103; 1069pp; English.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by c. p. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. C. pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. C. pacence is also involved in infections of bone, joints and the central cervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the conference or absence of P. acnes in a patient comprises contexting a sample with a binding agent that binds to the proteins of the invention of sample with a binding agent that binds to the protection of antibodies confered and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and theorem in the sample of the activity of the activity and the included as a diagnostic agents for determining P. acnes presence, for example, by construct in the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from Wipo to at ftp.wipo.int/pub/published\_pot\_sequences.

WPI; 2001-656860/75 N-PSDB; ABL11545. New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell Interactions

Disclosure; SEQ ID NO 29118; 21pp + Sequence Listing; English.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of

```
This invention describes a novel isolated nucleic acid from a plant or algae which encodes a polypeptide which extends a C 1 6, C 1 8 or C 2 0 fatty acid having at least two double bonds by at least two Carbon aroms. The products of the invention can be used to produce polyunsaturated fatty acids (PUFAs) in the form of oils, lipids or fatty acids in a method which comprises breeding organisms e.g. transgenic plants containing the above nucleic acids, constructs or vectors encoding a polypeptide which extends a C 1 6, C 1 8 or C 2 0 fatty acid having at least two double bonds by at least two carbon aroms, under PUFA forming conditions. The oils, lipids or fatty acid compositions produced by the invention are used in fodder, food, cosmetics and pharmaceuticals. The invention is more efficient at producing polyunsaturated fatty acids in a broad spectrum of plants than prior art. This sequence represents the C proad spectrum of plants than prior art. This sequence represents the cypthecodinium sp. elongses proctein isolated from clone Cc_PSEI which is described in the method of the invention.
                                                                                                                                                                                                                                             ö
                                                                                                     WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Elongase; plant; transgenic plant; fatty acid; PUFA; oil; lipid; food; polyunsaturated fatty acid; fodder; cosmetic; pharmaceutical.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving contribating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imparting of stres expressing (II). (I) and (II) are useful in medical insorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess blidiversity and to produce other types of data and products dependent on DNA and amino acid sequences ABG0010-ABG30377 represent novel human content that the printed amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed and print in a part of the form with and and the printed are form or in the printed and the form of the content of the content directly from WIPO New isolated polynuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity -Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder. Sequences ABB10981-ABB12330 represent 1150 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell prolletation or cell differentiation activities; stem cell growth factor activity; mannomodulatory activity; tissue growth activity; immnomodulatory activity; tissue growth activities; immnomodulatory activity; con inhibin-related activities; chemocactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; haemostatic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be

cc involved in oncogenesis, cancer cell proliferation or metastasis.

Cc bepending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myweloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), proliferative retinopathy, atherosclerosis, coronary heart disease.

Cr disorders, bohypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound repair (or nucleic acids encoding them) may be used to promote wound crepair (or nucleic acids encoding them) may be used to promote wound communicately acids in addition to immune disease in mean addition to immune disease to promote cell growth. For example, such polypeptides with growth factor activity may be used in cell cultures to promote cell growth factor activity may be used in cell continue disease or accidental damage. The polypeptides and nucleotides autoimmune disease or accidental damage. The polypeptides and in drug screening techniques. The present sequence represents a novel human con propertide of the invention.

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytckine. Cell proliferation or cell differentiation or which may induce production of other cytckines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.

Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication. Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy -Claim 20; Page 410; 6221pp; English

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; nootropic; immunosuppressant; oytostatic; gene therapy; cancer; peripheral nervous system; CNS; Alzhakimer's; Parkinson's disease; Humtington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Wang D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Gaps
Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ren F, W

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostaric activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as latherapt of the activities such as: Immune system diseases, such as attivities such as: Immune system suppression, activity, chemoteatic/chemokinetic activity, haemostatic and thrombolytic activity, chemoteatic/chemokinetic activity, architics and inflammation, leukaemias and consistent activity, arthritis and inflammation, leukaemias and consistent of the printed and this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Selectively labeled membrane peptides, useful e.g. for detecting ligand binding to receptors and in drug screening, are prepared, in lipid matrix, by reaction between amino acid residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
             Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Membrane polypeptide; lipid matrix; syntesis; ligation; chemoselective ligation; fluorescence resonance energy transfer; FRET; chromophore; ligand; receptor domain; drug screening; diagnosis; ion channel; melanocortin receptor; MC4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .;

Comparises chemospately by March membrane polypeptides can be an alighelled. The method comprises chemospately chemical ligation of the membrane polypeptide which is incorporated in a lipid matrix, and a ligation label. Both contain an aminon acid having an a ligation to form a covalent bond. The method can be used to label comproted the comparison of the method can be used to label injection to form a covalent bond. The method can be used to label colled polypeptides embedded in a lipid membrane, by treating the colled polypeptide with a reagent that cleaves specifically adjacent to an amino acid with an unprotected reactive group and then ligating the cleaved polypeptide with the ligation label. The ligation label can be a chromophore, thus ligand binding to membrane bound polypeptides can be detected by contacting a membrane bound polypeptides can be detected by contacting a membrane bound polypeptides can be detected by contacting a membrane bound polypeptides comprising a chromophore, with the ligand under investigation and screening for binding in an assay characterized by detecting fluorescence resonance energy transfer system. The methods are used for lipid matrix-assisted chemical ligation and synthesis of previously transfer system. The methods are used to detect ligand binding and the identification of receptor domains, e.g. for selection or design, and for diagnosis. The methods are particularly selection or design, and for diagnosis. The methods are particularly cused for fluorescent resonance energy transfer (FRET) analysis of previously inaccessible membrane polypeptides. The method allows and analysis of previously inaccessible membrane proteins. A methods are particularly cused for (AAY83182) can be cleaved with factor Xa to give a creaminal alpha-thiosster modified MC4 receptor ligation label sourprises a factor Xa cleavage of the condition of cleaved with factor Xa to give a condition of cleaved with factor Xa to give a condition of cleaved with factor synthetic labeled membrane polypeptide s

Chemoselective chemical ligation of membrane polypeptides useful for assaying ligand binding to membrane polypeptides, involves covalently binding polypeptides incorporated in a lipid matrix with ligation labels

Example 11; Column 48; 52pp; English.

The invention relates to chemoselective chemical ligation (CCL) of a membrane polypeptide, (M1) involves contacting (under CCL conditions):

(a) polypeptide (T) incorporated in lipid matrix, comprising first amino acid (A1) having unprotected reactive group; (b) with ligation label (II) comprising second amino acid (A2) having unprotected reactive group; (b) with ligation correlated in a lipid matrix and at least on non-naturally corrusting amino acid comprising a compatible of CCL with A1, and connecting (1) with (II) causes and A2). Also included are a composition comprising an integral membrane polypeptide embedded in a lipid matrix and at least on non-naturally corrusting amino acid comprising a unprotected reactive group; and a composition comprising a membrane polypeptide has at laast two amino acid residues composition comprising a membrane polypeptide has at laast two amino acid residues composition comprising a non-natural backbone bond). The method is useful for chemoselective chemical ligation of a folded membrane polypeptide has at lass two amino acid residues composition or minegral or transmembrane polypeptide is a receptor. The method is useful for detecting a ligand that directly or indirectly interacts with a folded membrane polypeptide embedded in a lipid matrix. This compounds for drug development, and other structural and functional assays that employ binding of a ligand to a pre-folded membrane polypeptides and domains comprising a receptor, and thus are compounds for drug development, and other structural and diagnostics, error individually useful for structure/function studies, drug creening/selection/design and others are compositions are compounds previously inaccessible membrane energy transfer (FET) analyses of previously inaccessible membrane energy transfer (FET) analyses of previously inaccessible membrane energy transfer (FET) analyses of previously inaccessible membrane polypeptides the melanocortin receptor, MC4, factor Xa prevent sequence is the melanocortin receptor.

                                                                                                                                                                                                                                                                                                                                ઠે
                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                        The invention relates to a method for identifying an animal having a genotype that indicates good meat quality traits such as drip loss, marbling, pH and colour. This involves assaying a nucleic acid for a polymorphism in the melanocortin-4 receptor (WG4R) gene, which is associated with meat quality traits in animals. Assaying for the presence of at least one genetic marker at this gene region allows genetic evaluation. The method is used to identify meat producing animals, such as pigs, cows, sheep and chickens, with favourable meat quality traits, particularly to select animals for breeding and to ensure uniformity at slaughter. This sequence represents the human melanocortin-4 receptor. Note: The specification states that this protein is encoded by the DNA sequence featured in AAS14759.
                                                                                                                                             Identifying genotype associated with good meat quality, useful e.g. for selecting animals for breeding, by detecting a polymorphism in the melanocortin-4 receptor gene -
                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention relates to coding sequences (see AAF44740-F44840 and AAF44443-F44844) and proteins (see AAB65714-B65814) involved in programmed cell death (PCD; apoptosis). The coding sequences and proteins of the present invention are useful for modulating a PCD or cell death pathway and various developmental pathways in a forestry plant, by stably incorporating one of the present coding sequences into the genome of the forestry plant, where the coding sequence provides a PCD pathway that is not present in a native form of the forestry plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAW19703-W19707 represent the human and mouse melanocortin (MC) breceptors. This sequence represents the MG4K, expressed primarily in brain, but absent in the adrenal cortex, melanocytes and placenta. The gene encoding this sequence is located at chromosome locus 18921.3. Mcs are products of pro-opiomelanocortin post-translational processing, and are known to have a broad array of physiological actions. Mcs are known to have a broad array of physiological actions. Mcs are known to have a drenal cortical functions and on melanocytes, as well
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Melanocortin-3; MC3R; MC1R; MC2R; MC4R; MC5R; human; mouse; melanocyte; pro-opionelanocortin; adrenal cortical function; behaviour; learning; memory; cardiovascular system; analgesia; thermoregulation; prolactin; neuronumoral agent; biogenic amine.
Novel defender against cell death polynucleotide useful for modulating programmed cell death pathway and specific development pathways in forestry plant -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

ö

as affecting behaviour, learning, memory, control of the cardiovascular system, analgesia, thermoregulation and the release of other neurohumoral agents (such as prolactin and biogenic animaes). The nucleic acids can be used to transfect mammalian cells lacking endogenous MC receptors to induce their expression. These sequences can also be used to screen and identify drugs which specifically react with MCRs on the surface of a cell. The drugs can then be used for treating diseases which have MCRs implicated as one of their causes. Vectors containing these sequences can also be used to treat the diseases. 888888888888888

DNA encoding melanocortin-5 receptor - useful in hybridisation assays for melanocortin-5 receptor nucleic acids

Disclosure; Column 43-46; 58pp; English.

The present sequence represents the human melanocortin-4 (MC4) receptor, the gene of which has been localised to chromosome 18q21.3. This seceptor is activated by both the amino and carboxyl terminal end amino acids of melanocortins and has been found to be expressed primarily in the brain and is absent from in the adrenal cortex, melanocytes and blacenta. The DNA sequence that produces this polypeptide was identified by using oligonucleotides constructed from previously identified receptors MC1 and MC3, this was performed by using these oligonucleotides constructed from previously identified receptors MC1 and MC3, this was performed by using these oligonucleotides genes and their products may be used to provide therapeutic vehicles for the treatment of processes involving the function of melanocortin

Identifying melanocortin receptor agonists and antagonists - usin panel of recombinant mammalian cells expressing alpha-melanocyte stimulating hormone, ACTH, MC-3, MC-4 and MC-5 receptors

This is the amino acid sequence of the human melanocortin-4 receptor (MCR-4). The MCR agonists and antagonists can be used for modifying feeding behaviour in an animal. The artagonists can be used for stimulating feeding while the agonists can be used for inhibiting feeding. They can be used for the treatment of eating disorders such as anorexia and obesity, and other pathological weight and eating-related disorders. They can also be used to treat failure to thrive disorders and disease-related cachexia, such as occurs in cancer patients, as well as other metabolic disorders.

Sequence

228 VLPGTGA 234

```
The sequence is that of a mutant melanocortin 4 receptor (MC4-R), the mutation is the Ile137Thr mutation. The sequence can be used in the generation of drug screening assays to identify compounds which could be used in the treatment of body weight disorders e.g. obesity, anorexia and cachexia. Specific compounds include agonists or antibodies that bind and activate the MC4-R to induce weight loss, an antibody or extracelluar domain of the MC4-R that inhibits MC4-R activation and therefore induces weight gain or an oligonucleotide that inhibits translation by encoding an antisense or ribozyme molecule that targets MC4-R transcripts or by forming a triple helix with the MC4-R gene "Dromoter to induce weight gain." (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Drug screening assays to identify compounds for body weight disorder treatment - e.g. obesity, anorexia and cachexia, using melanocortin 4 receptor as target

```
The sequence is that of a mutant melanocortin 4 receptor (MC4-R), the mutation is the Val10211e mutation. The sequence can be used in the generation of drug screening assays to identify compounds which could be used in the treatment of body weight drogeness e.g. obseity, anorexia and cachexia. Specific compounds include agonists or antibodies that bind and activate the MC4-R to induce weight loss, an antibody or extracelluar domain of the MC4-R that inhibits MC4-R activation and therefore induces weight gain or an oligonuclectide that inhibits translation by encoding an antisense or ribozyme molecule that targets mC4-R transcripts or by forming a triple helix with the MC4-R gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                               Drug screening assays to identify compounds for body weight disorder treatment - e.g. obesity, anorexia and cachexia, using melanocortin 4 receptor as target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

The sequence is that of a mutant melanocortin 4 receptor (WC4-R), the mutation is the Thr112Met mutation. The sequence can be used in the generation of drug screening assays to identify compounds which could be used in the treatment of body weight disorders e.g. obesity, anorexia and cachexia. Specific compounds include agonists or antibodies that bind and activate the MC4-R to induce weight loss, an antibody or extracelluar domain of the MC4-R that inhibits MC4-R activation and threnefore induces weight gain or an oligonucleotide that inhibits MC4-R ranstarion by encoding an antisense or ribozyme molecule that targets MC4-R ranscriptes or by forming a triple helix with the MC4-R gene promoter to induce weight gain. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Drug screening assays to identify compounds for body weight disorder treatment - e.g. obesity, anorexia and cachexia, using melanocortin 4 receptor as target

This is a human melanocortin receptor-4 (MC4). The MC4 receptor of this invention is activated by amino acids in the carboxyl and amino terminal portions of the heptapeptide sequence shared by all the melanocortin peptides. MC4 is expressed primarily in brain and is notably absent in the adrenal contex, melanocytes and placenta. The MC4 receptor gene was localised to chromosome loci 18021.3. The invention provides methods to identify 11gands that bind to MC4 receptor.

DNA encoding human melanocortin-4 receptor - and cells useful in assay for MC4 receptor ligands

MC4-R is a G-protein coupled receptor. The invention relates to the cloning, expression and functional characterisation of mammalian melanocortin receptor. MC1-R, MC2-R, MC3-R, MC4-R and MC5-R nucleic acids (see AAV63702-08) and polypeptides (see AAW87664-70), as well as expression constructs, cukaryotic cells transformed with such constructs, knockout animals, and methods and reagents for developing agonists and antagonists specific for mammalian melanocortin receptors. Such compounds, particularly those specific for MC5-R, are used to treat disorders of exocrine gland function, e.g. of the lacrimal or esbaceous glands particularly acne, other skin disorders and 'dry eye', also disorders related conditions.

Homo sapiens

```
This sequence represents the human melanocortin-4 receptor, MC4. This protein is used in a method in which a nucleic acid probe useful for specifically detecting melanocortin-4 receptor genes is described. This probe is used to isolate genes encoding melanocortin receptors, to characterise melanocortin receptor binding and secondary signalling and to determine tissue distribution of the melanocortin receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                The present sequence represents human melanocortin receptor polypeptide. Melanocortin-1 and melanocortin-2 receptor genes have been localised to chromosome 1624-13 and 18p1.2, respectively. The melanocortin-3 receptor gene has been localised to chromosome loci 20q13.2-q13.3. The melanocortin-4 receptor has been localised to chromosome 18q21.3. The melanocortin-3 receptor is activated primarily by the core heptapeptide sequence of melanocortins, with an adjacent terminal tyrosine being required for full activation. The melanocortin receptors and their respective genes are useful in providing therapeutic vehicles for the treatment of processes involving the function of melanocortin receptors. The genes encoding the melanocortin receptors are useful for transfecting mammalian cells lacking endogenous melanocortin receptors to induce
                                                                                                                                                                                                                                                                        New melanocortin receptor polypeptides MC3 and MC4, and genes encoding the receptors, useful for providing therapeutic vehicles employed in treating disorders involving melanocortin receptor function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention describes transmembrane receptors, preferably human G protein coupled receptors (GPCR), for which the endogenous human G brotein coupled receptors). More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists, inverse agonists or partial agonists for use as pharmaceutical agents.

AAA46017 to AAA46126 and AAB02825 to AAB02859 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human G protein coupled receptor hMC4 (A244K) protein SEQ ID NO:136.

The present sequence is the rhesus monkey melanoicortin-4

receptor protein (MC-4R). Melanocortin receptors belong to the rhodopsin

sub-family of G-protein coupled receptors. They bind and are

activated by peptides such as alpha., beta., or gamma-melanocyte

activated by peptides such as alpha., beta., or gamma-melanocyte

are believed to mediate a wide range of physiological functions.

The rhesus MC-4R gene was isolated by PCR using a series of four

oligonucleotides (AAA26973-A26976) based on the human MC-4R gene sequence

and designed to incorporate a restriction enzyme site for oloning into

the expression vector pCI-neo. The recombinant vector was transformed

into DH5a cells in preparation for DNA sequencing. The MC-4R gene

sequence (AAA26973) or a mutated form may be introduced into an

sequence (AAA2692) or a mutated form may be introduced into an

sequence (AAA2692) or a mutated form may be introduced into an

expression vector for expression in host cells. The subcellular

membrane fractions will comprise either wild-type or mutant forms of

these will allow for selection of compounds that are active for

AC-4R. This will allow for selection of compounds that are active for

the receptor in vitro and will allow the selection of novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel DNA encoding rhesus monkey melanocortin 4 receptor protein, recombinant vectors and host cells, useful in methods for identifying selective agonists and antagonists -
                                                           Rhesus monkey, rhodopsin, G-protein coupled receptor, anorectic, melanocyte stimulating hormone, melanocortin receptor, obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Melanocortin receptor MC4 comprising Factor Xa cleavage site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes transmembrane receptors, preferably human G protein coupled receptors (GPCR), for which the endogenous ligand is unknown (orphan GPCR receptors). More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists, inverse agonists or partial agonists for use as pharmaceutical agents. Example 11; Page 68-69; 120pp; English

New methods are described by which membrane polypeptides can be labelled. The method comprises chemoselective chemical ligation of the membrane polypeptide which is incorporated in a lipid matrix, and a ligation label. Both contain an amino acid having an unprotected reactive group that together undergo chemoselective injection to form a covalent bond. The method can be used to label folded polypeptides embedded in a lipid membrane, by treating the claded polypeptide such a transporter active group and then ligation label can be a chromophore, thus ligand binding to membrane bound polypeptides and be actoromophore, with the ligation label. The ligation label can be a chromophore, with the ligation label. The ligation label can be a chromophore, with the ligation label. The ligation and screening for a chromophore, with the ligation label. The ligation and screening for a chromophore, with the ligation label. The ligation and screening for a resonance energy transfer (FRET) between the chromophore and a second chromophore, the chromophores comprising a donor and acceptor pair of a resonance energy transfer system. The methods are used for lipid matrix-assisted chemical ligation and synthesis of membrane polypeptides. Labeled membrane polypeptides are used to detect ligand colypeptides. Labeled membrane polypeptides are used to detect ligand structure/activity studies. They can also be used in drug screening, selection or design, and for disagnosis. The methods are particularly used for flooreporation of labels during polypeptides. The method allows are used for flooreporation of labels during polypeptides. The method allows are used for flooreporation of labels during polypeptides. The method allows and analysis of previously inaccessible membrane polypeptides are corpused product (AAY81183) and an MC4 receptor membrane polypeptide synthetic labeled MC4 product (AAY81184). Chemical ligation of cleaved MC4 in alternative membrane packness or miceles to an MC4 ligation all pagetine in an MC4 ligation and belance o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to methods for the identification of compounds that regulate addictive behaviour, particularly drug addiction. The method compities determining whether a test compound can bind to and metagonise a melanocortin+ receptor (MC4-R), and administering that compound to an animal in order to see if a reduction in addictive behaviour occurs, Melanocortins are products of pro-opiomelanocortin post-translational processing which are thought to have a broad range of physiological actions, including behaviour, learning, memory, analgesia, thermoregulation and body weight, as well as their well known effects on adrenal cortical functions and on melanocytes. The present invention is based on the observations that MC4-R activity potentiates some of the addictive effects of drugs of addiction, particularly occaine and morphine, and that knockout mice do not display the behavioural responses indicative of addiction caused by chronic and/or acute administration of these compounds may be used to threat addiction to a wide variety of substances, including cocaine, opiates, alcohol, hallucinogens, minor trangulisers, nicotine and stimulants. The methods are also useful for the treatment of addictive behaviour disorders, including extreme crawing, addictive psychological disease or obsessive-compulsive caving, addictive psychological disease or obsessive-compulsive

The specification describes transgenic non-human animals whose somatic and germ cells contain at least one non-functional gene for MC-4R protein. The transgenic animals, or cells derived from them, are used to screen for compounds that modulate MC-4R. These modulators are potentially useful for regulating body weight and food intake and treatment of associated diseases, obesity; diabetes; anorexia; cachexia; cancer; sexual dysfunction; pain; impaired memory or neuronal and insulin-like growth factor-1. They can also be used to study MC-4R expression and activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New transgenic animal with non-functional gene for melanocortin-4 receptor, useful for identifying specific modulators, potentially used for treating obesity or diabetes
                                                                                                                                                                                                                                         Human; melanocortin-4 receptor; MC-R4; transgenic animal; body weight; food intake; obesity; diabetes; anorexia; cachexia; cancer; sexual dysfunction; pain; impaired memory; neuronal regeneration; neuropathy; growth disorder; growth hormone; insulin-like growth factor-1.

Human melanocortin 4-receptor (MC4R)

Human, single nucleotide polymorphism, SNP, melanocortin 4-receptor; MC4R, haplotype, obesity, screening, allele-specific oligonucleotide; ASO, gene therapy, anorectic, chromosome 18q22.

Homo sapiens

Novel polymorphic variants of melanocortin 4-receptor gene useful in studying expression and function of the protein, useful for screening candidate drugs to treat diseases related to the protein activity e.g. obesity

Claim 27; Fig 3; 53pp; English.

The invention relates to single nucleotide polymorphisms (SNP) in human melanocortin 4-receptor (MC4R) gene. MC4R gene haplotypes are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with MC4R activity, e.g. obesity. MC4R gene is useful in studying the expression and function of MC4R and in expressing MC4R protein for use in screening for candidate drugs to treat diseases related to MC4R activity and in studying the effect of the variation on the biological activity of MC4R as well as on the binding affinity of candidate drugs to argetting MC4R for the treatment of obesity. MC4R candidate drugs targetting MC4R for the treatment of obesity. MC4R and in therapeutic methods. Allele specific oligonucleotide (ASO) is useful as probes and primers, and for assaying a polymorphism in MC4R gene. MC4R gene is located on chromosome 18922.

Patent No. 6100048

MAPLICANT: Cone, Roger D

APPLICANT: Cone, Roger D

APPLICANT: Resterion, Robert A

APPLICANT: Chen, Webiac

TITLE OF INVENTION: Using Mammalian Melanocortin Receptor Agonists and Antagonist

TITLE OF INVENTION: To Modulate Feeding Behavior in Animals

NUMBER OF SEQUENCES: 19

CORRESPONDENCE ADDRESS:

ADDRESSEE: McDonnell Boehnen Hulbert & Berghoff

STREET: 300 South Wacker Drive

CITY: Chicago

STATE: IL

Dedence 31144, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
APPLICANTIN MARC J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ABRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR PAPLICATION NUMBER: US 60/074,788
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 31444

LENGTH: 354
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 644', Application US/09328352

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Description

MAX32 protein - yeast (Saccharomyces cerevisiae)

NyAlternate names: protein YCR019w

C;Species: Saccharomyces cerevisian

C;Date: 30-Jun-1991 #sequence_revision 30-Sep-1993 #text_change 16-Jun-2000

C;Accession: S19429; 807695

R;Feldmann, H.; Mannhaupt, G.; Vetter, I.

Submitted to the Protein Sequence Database, March 1992

R;Reference number: S19429

A;Molecule type: DNA

A;Residues: 1-363 <FEL>
A;Coss-references: EMBL:X59720; NID:g1907116; PIDN:CAA42310.1; PID:g1907162; GSPDB:GN(
